Bring convenience to patient cancer care

Leap coordinates infusion in your patients' homes and at nearby clinics, following your treatment plan so you stay in full charge.

We prioritize patient safety and clinical excellence

We take an evidence-based approach aligned with national safety standards. Our protocol is grounded is guidance from the Oncology Nursing Society (ONS) and the American Society of Clinical Oncology (ASCO).

Why choose Leap

- **Leap partners with infusion nurses** to coordinate care in your patients' homes or at Leap-associated infusion centers to free up capacity within your own practice for other patients.
- **Leap supports on prior authorizations, insurance checks,** billing questions, copay assistance, medication delivery, and nurse scheduling to give you time back.
- **You keep prescribing authority** and clinical oversight. We follow your treatment plan as written, send documented notes after every visit, and notify your office immediately of any clinical event.
- **We expand patient access** when transportation challenges, mobility issues, or compromised immunity make frequent clinic visits challenging.

98%
patient satisfaction

Our clinical standards

1 Appropriate therapy & patient selection

Eligible therapies include single-agent, maintenance-phase immunotherapy and supportive care — FDA-approved agents with established safety profiles, used per labeling, or NCCN-recognized compendia selected for low infusion-related risk. Each patient undergoes an assessment in collaboration with their treating physician and is matched to the most appropriate setting.

2 Established tolerability & treatment clearance

Consistent with ONS/ASCO guidance, patients enter the program only after they are clinically stable and have tolerated prior doses of their agent. Transition to the home or an infusion center follows a documented step-down pathway.

3 Oncology-trained clinical team

Infusions are administered by experienced oncology-trained nurses with documented immunotherapy and supportive-care competency across both home and infusion center settings. All nurses maintain a current ONS/ONCC Chemotherapy Immunotherapy Certificate or have oncology experience, maintain active BLS certification, and complete annual competency assessments per Joint Commission standards.

4 Emergency preparedness & escalation

Every visit is equipped with emergency medications, reaction-management protocols, and spill kits. Any Grade ≥2 reaction triggers immediate protocol-driven management on-site, same-day prescriber notification, and a documented escalation pathway to your office and emergency services.

5 Closed-loop monitoring & communication

Every infusion is thoroughly documented and notes are sent to your office after each treatment, keeping you and your team fully informed.

Leap services a wide range of oncology and supportive therapies

+ Single-agent maintenance immunotherapy (Keytruda, Keytruda Qlex, Darzalex Faspro, Opdivo, etc.)
+ Bone-modifying agents (Prolia, etc.)
+ Hematopoietic growth factors (Neulasta, etc.)
+ Iron infusions
+ Other supportive care infused and injectable therapies
